9. Index of First Occurrence in a String

Aim

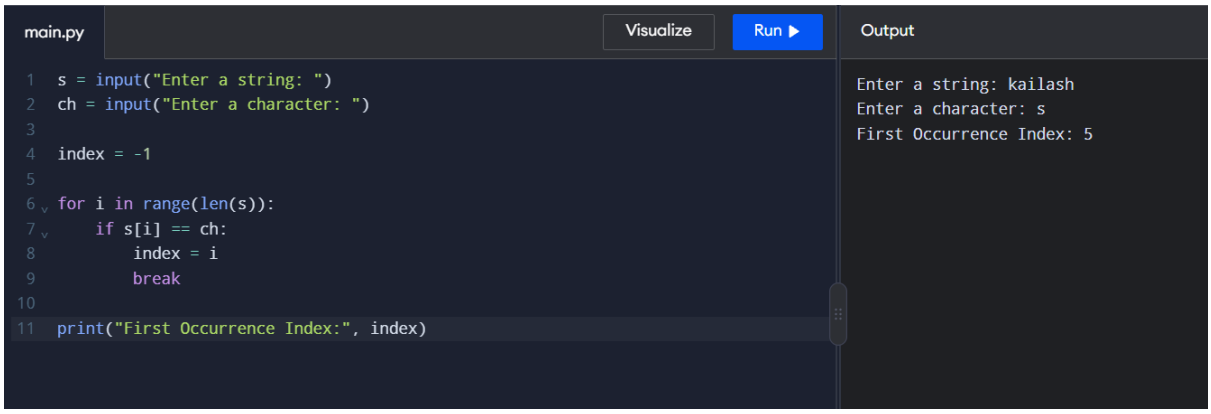

To find the index of the first occurrence of a character in a string and analyze its time and space complexity.

Algorithm

1. Read a string and a character to search.
2. Traverse the string from left to right.
3. Compare each character with the search character.
4. If a match is found, print its index and stop.
5. If no match is found, print -1.

Procedure

1. Start the program.
2. Read the string and search character.
3. Check each character using a loop.
4. If the character matches, display its index.
5. Otherwise, display -1.
6. Stop the program.

Result

Thus, the index of the first occurrence of a character in a string was successfully found and its complexity was analyzed.
